

# Creating crisp sections of thick samples with ease

## ZEISS Microscope Bundle for Optical Sectioning

*Transgenic zebrafish larvae at 4 days post fertilization with neuronal and glial cells labeled with Hoechst, Alexa488, Alexa546, Alexa647.

Optical sectioning is used to efficiently create crisp images of thick samples by removing out-of-focus light. While hardware-based technologies such as confocal laser scanning microscopy or Apotome are sophisticated, powerful and robust, software-based solutions can provide additional features to further improve image quality at high acquisition speeds. Used with or without additional hardware, they can be an attractive solution to easily convert a classic wide-field microscope into a microscope for optical sectioning.

### The ZEISS Bundle for Software-based Optical Sectioning

The system bundle was designed to image optical sections of various sample types like organoids, tissues, or plant cells with high resolution and fast acquisition speed. The components form the ideal solution for fast acquisition and efficient data evaluation.

#### Hardware

The microscope is equipped with AI Sample Finder for fast experiment startup and efficient navigation. The Colibri 7 light source with seven excitation wavelengths and filter sets covering the entire visible range combine highest spectral flexibility with low phototoxicity. The sensitive and fast camera AxioCam 705 completes the system with high resolution, high frame rates, and a large field of view.

#### Software

The perfectly matched selection of modules, all integrated into ZEN, ensures efficient workflows from image acquisition to data evaluation. Process your images directly after acquisition with Direct Processing, using one or several functions like deconvolution, deblurring or denoising. With the 3Dxl viewer, precise 3D renderings can be created, allowing to inspect and export your data with ease. The community-based APEER platform lets you to create evaluations customized for your specific application. In APEER, a broad selection of evaluations commonly used in microscopy lower the entry barrier for best usability.

# ZEISS Microscopes for Optical Sectioning

## The Bundle Components

### Microscope

- Axio Observer 7 (inverted)
- Axio Imager 2 (upright)
- Scanning stage 130 × 100
- Mot. Condenser NA 0.55<sup>1</sup> / NA 0.9<sup>2</sup>
- AI Sample Finder<sup>1</sup>

### Light source / camera

- Colibri 7
- Filter sets HE LED 90, 91, 112
- AxioCam 705 mono

### Objectives

- EC Plan-Neofluar 5×/0.16<sup>1</sup>
- Fluor 5×/0.25<sup>2</sup>
- Plan-Apochromat 20×/0.8
- Plan-Apochromat 63×/1.4 Oil

### Workstation

- Z6 Workstation with 128 GB RAM and nVidia Quadro RTX6000 24 GB

<sup>1</sup>Axio Observer 7, <sup>2</sup>Axio Imager 2

Depending on your application needs, you can either choose an inverted configuration based on ZEISS Axio Observer 7 (left) or an upright configuration based on ZEISS Axio Imager 2.

### ZEN software modules

- Z stack: Acquire Z stacks with the help of a motorized focus drive.
- Tiles & Positions: Generate precise, high-resolution images through automatic scanning of predefined regions and positions of a sample.
- Deconvolution: Use 3D deconvolution algorithms to enhance your 3D image stacks.
- Direct Processing: Perform time-consuming image processing tasks simultaneously during image acquisition.
- Software Autofocus: Determine the optimum focus position of the specimen.
- Time Lapse: Acquire images over a period of time.
- ZEN Connect: Visualize data from different modalities for best overview and correlation.
- 3Dxl: Visualize 3D/4D image stacks.
- APEER: Cloud-based platform to solve your microscopy image processing tasks.

U2OS cells having nuclei stained with DAPI (blue), actin fibres stained with Alexa488 (green) and mitochondria stained with MitoTracker™ Red (red).

Drosophila egg chambers of different stages stained with DAPI (blue), Alexa488 (green) and Alexa555 (red). Sample Courtesy of Vanessa Weichselberger, University Freiburg, Germany.
